

概要

an gフォーマットE B S DデータをL a b o T e x, M T E Xに読み込み再計算極点図を比較する。

M T E Xでは、FWHMがパラメータで平滑化が行われている。

E N S Dデータは、E B S D t o O D Fソフトウェアで

で読み込み、L a b o T e x向けS O Rファイル

M T E X向けC T Fファイルを作成する。

M T E Xでは、パラメータであるFWHMを変えてO D F解析を行い極点図をE x p o r tし、L a b o T e xと比較する。

an gデータの読み込み変換

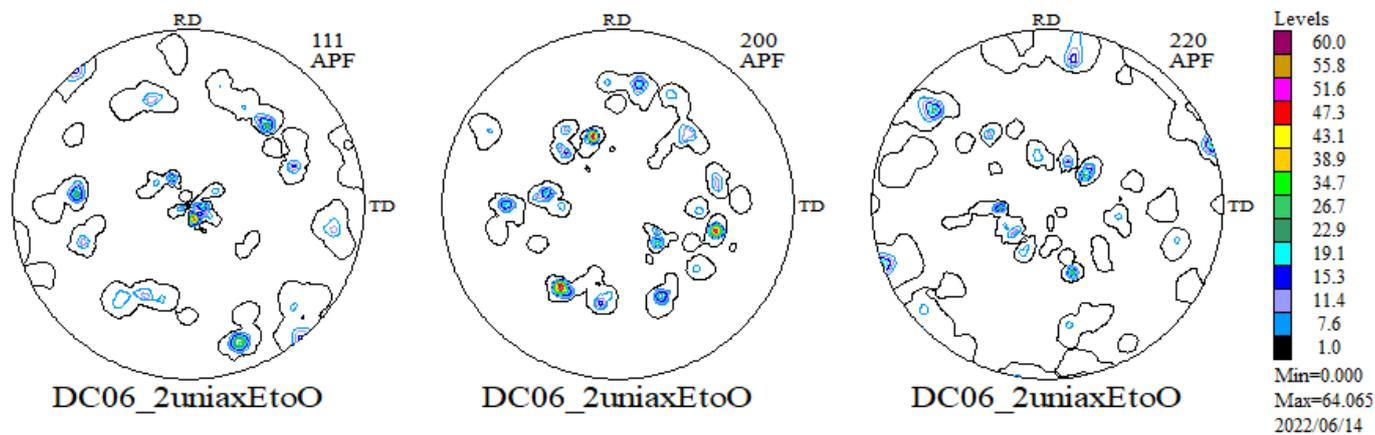

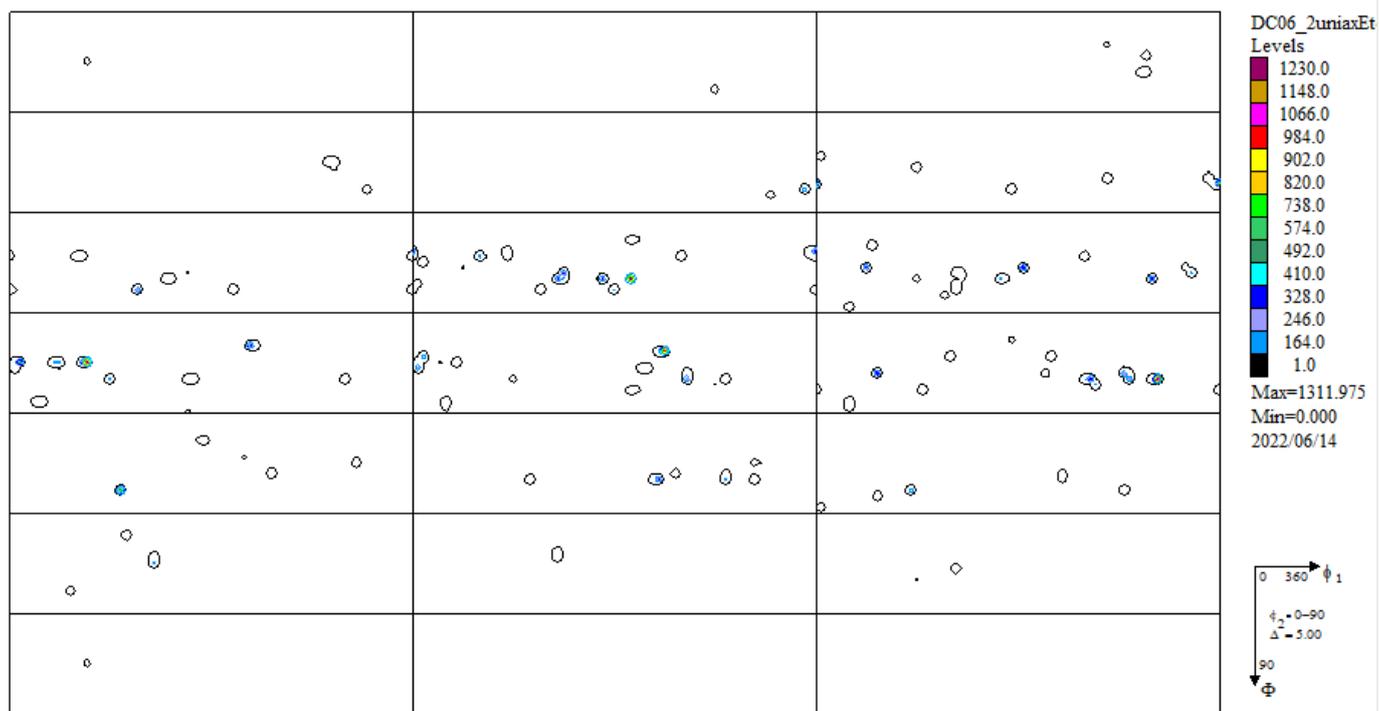

The screenshot shows the EBSDtoODF 1.01T software interface. The window title is "EBSDtoODF 1.01T[22/12/31] by CTR". The interface is divided into several sections:

- InputData:** InputFile is set to "C:\mtex-5.1.1\data\EBSD\DC06_2uniax\DC06_2uniax.ang" and the material is set to "Iron(Alpha)".
- MaterialData:** Material is set to "cif" and the file type is ".TXT .cif file". Group is "P1", Symmetry(OIM) is "43", HKLCode is "11", and LaboTexCode is "7 - O (cubic)". Aaxis, Baxis, and Caxis are all set to "2.87". alpha, beta, and gamma are all set to "90.0".
- Output Data:** A list of parameters is displayed, including TEM_PIXperUM (1.000000), x-star (0.521621), y-star (0.845559), z-star (0.690009), WorkingDistance (14.000000), Phase 1 (Iron (Alpha)), Formula (Fe), Symmetry (43), LatticeConstants (2.870 2.870 2.870 90.000 90.000 90.000), and NumberFamilies (100). It also lists 18 hklFamilies.
- Makefile:** DataStartline is "135", PhasePotision is "8", and Selectphase is "1". The Holder is set to "C:\mtex-5.1.1\data\EBSD\DC06_2uniax\DC06_2uniaxEtoO.ang". The OIM-Ang dropdown menu is open, showing options: OIM-Ang, HKL-ctf (selected), and LaboTex-SOR.

an gデータからctf、SORファイルを作成

mtex-5.1.1 > data > EBSD > DC06_2uniax

名前	更新日時	種類	サイズ
DC06_2uniax.ang	2020/10/15 5:49	ANG ファイル	805 KB
DC06_2uniaxEtoO.ctf	2022/06/14 20:33	CTF ファイル	292 KB
DC06_2uniaxEtoO.SOR	2022/06/14 20:33	SOR ファイル	162 KB

注意：データ点数が少ないと再計算極点図は計算できない。

MTEXで読み込み、FWHMはデフォルト

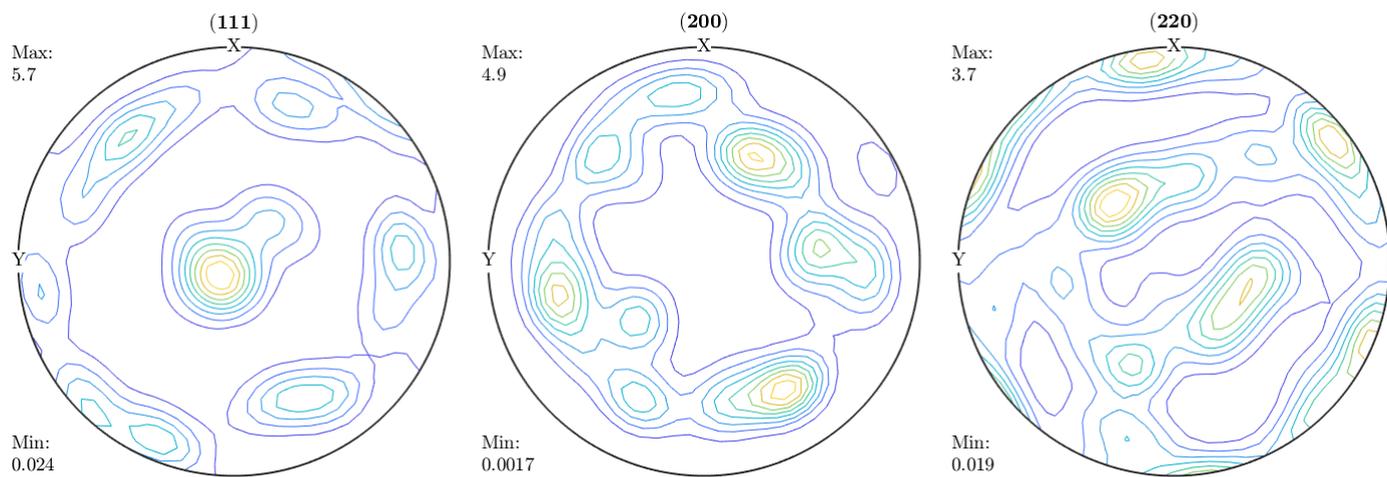

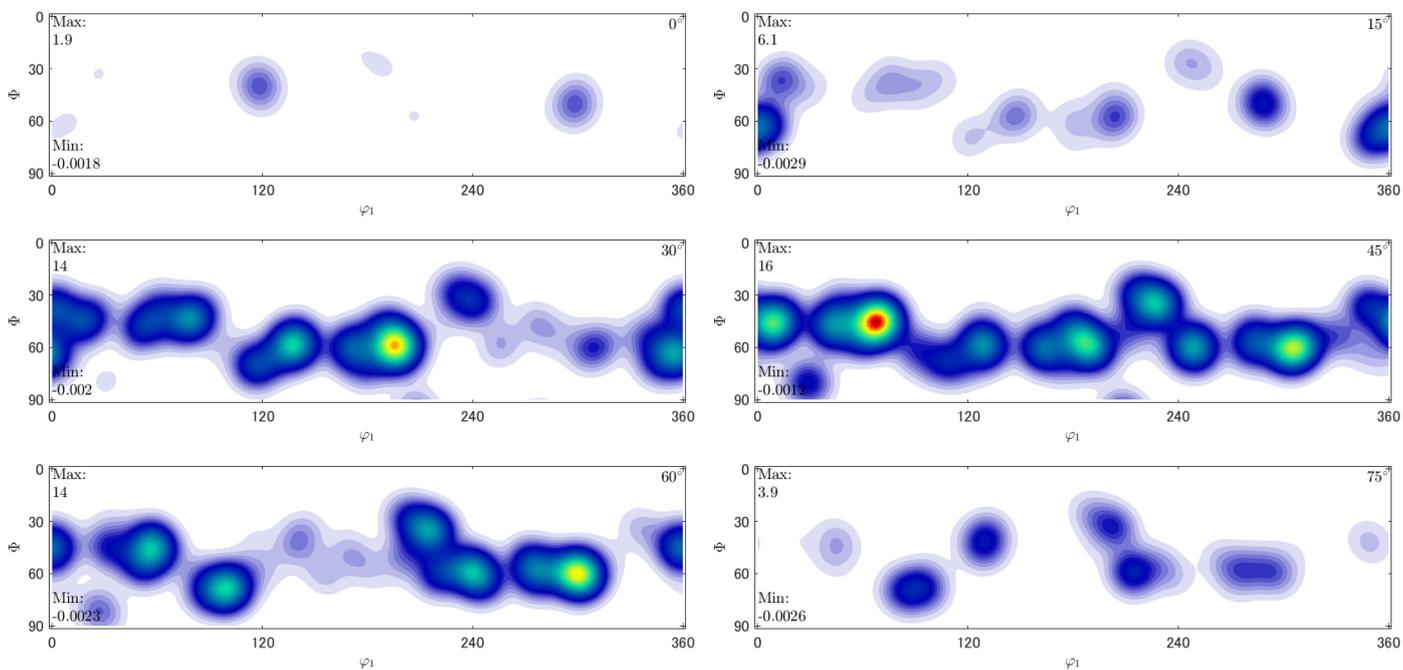

odf=calcODF(ans.orientations)

```
odf = ODF (show methods, plot)
crystal symmetry : Iron(Alpha) (m-3m)
```

Harmonic portion:

degree: 25

weight: 1

ODF Max = 16, 極点図 Max = 5.7

LaboTexでは1311.97と64.06である。

では、LaboTexと同程度の値にしてみます。

```
>> odf20=calcDensity(ebsd.orientations,'halfwidth',2.0*degree)
```

```
odf20 = ODF (show methods, plot)
```

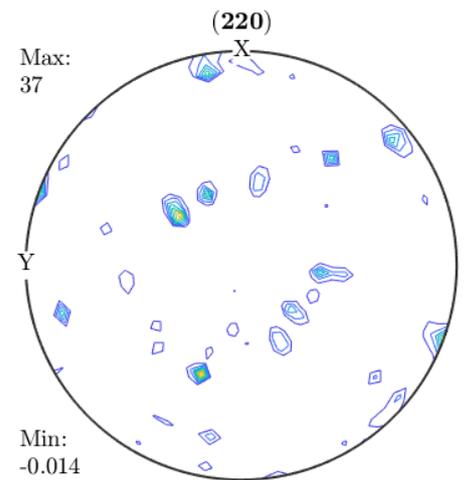

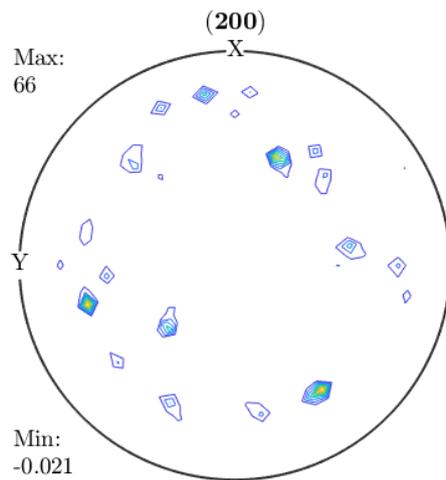

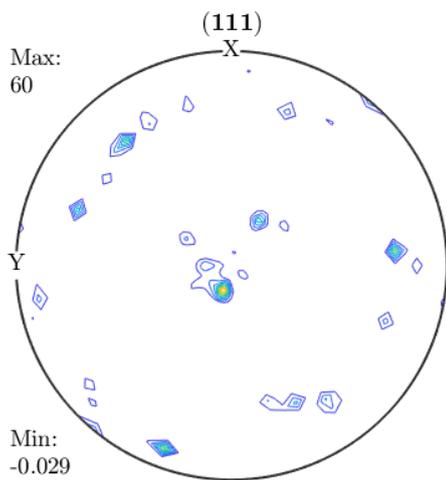

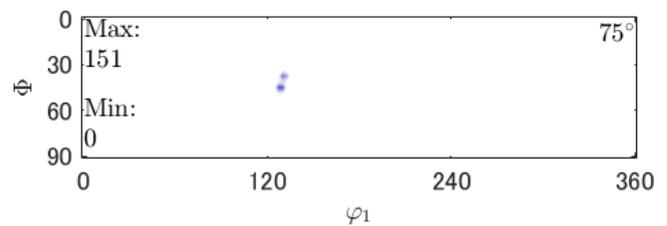

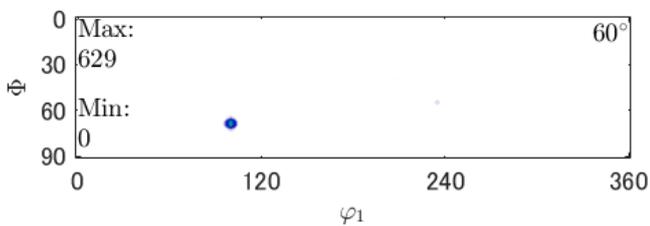

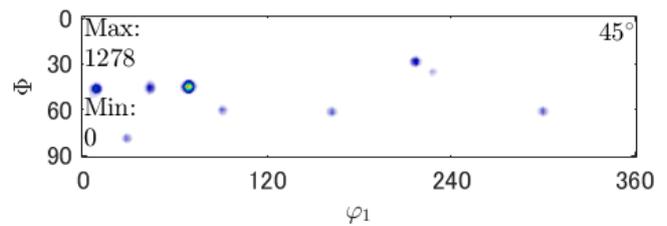

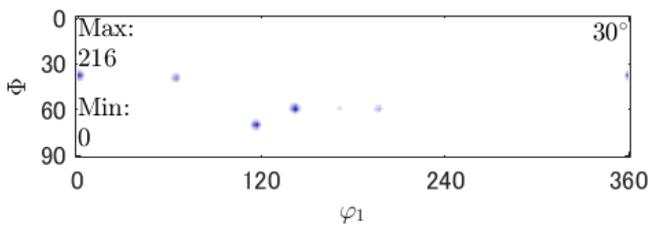

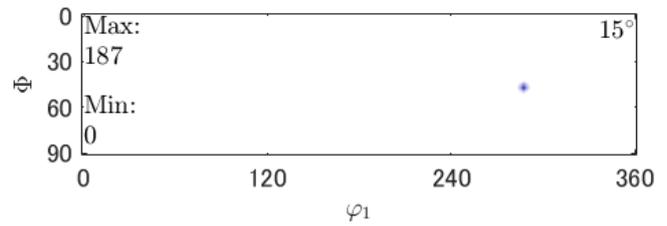

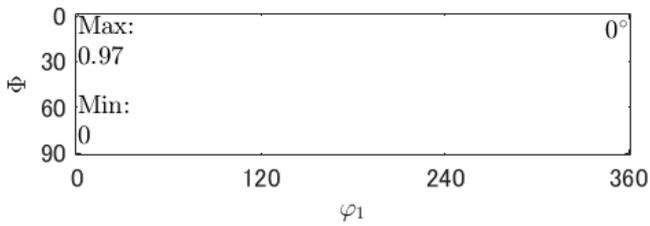

```
crystal symmetry : Iron(Alpha) (m-3m)
```

```
Radially symmetric portion:
```

```
kernel: de la Vallee Poussin, halfwidth 2°
```

```
center: 168 orientations, resolution: 1°
```

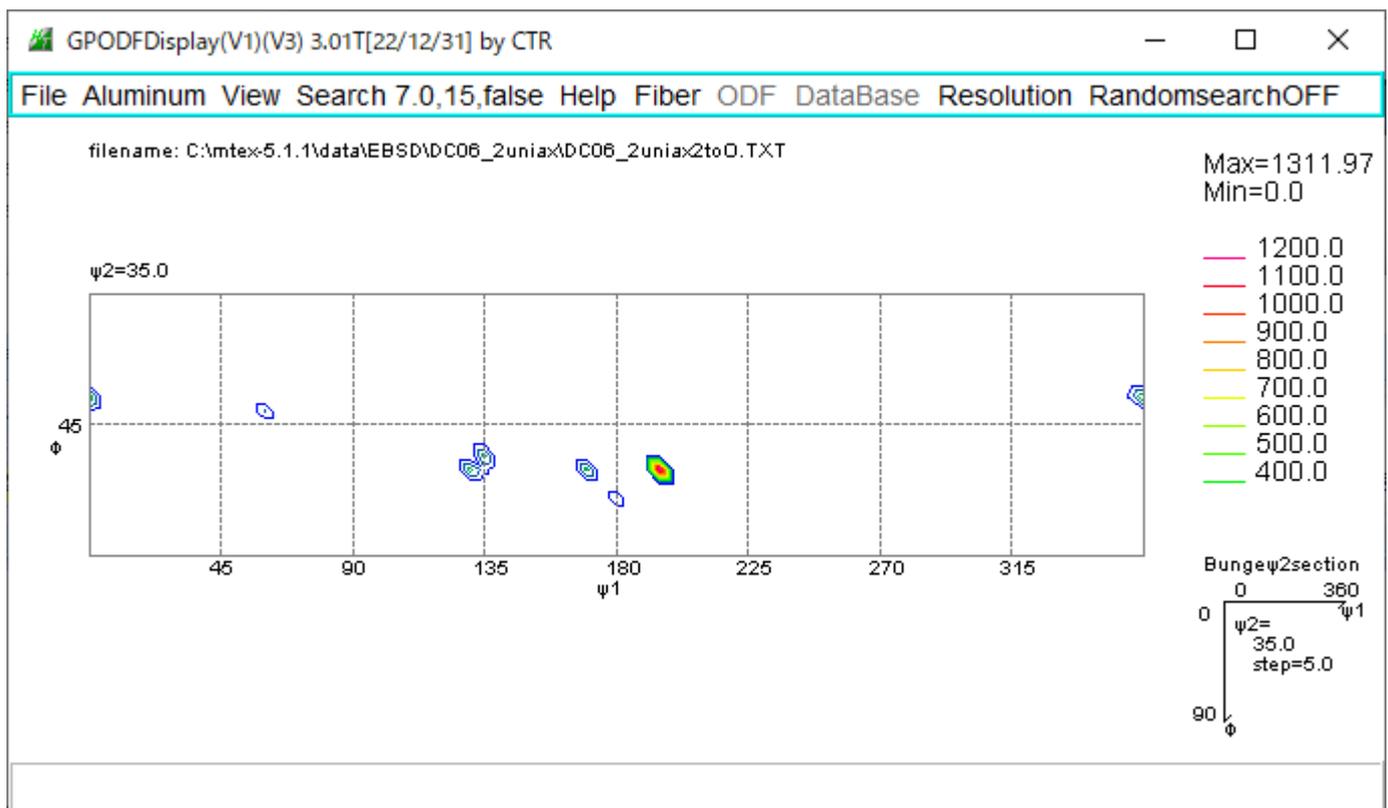

```
weight: 1
```

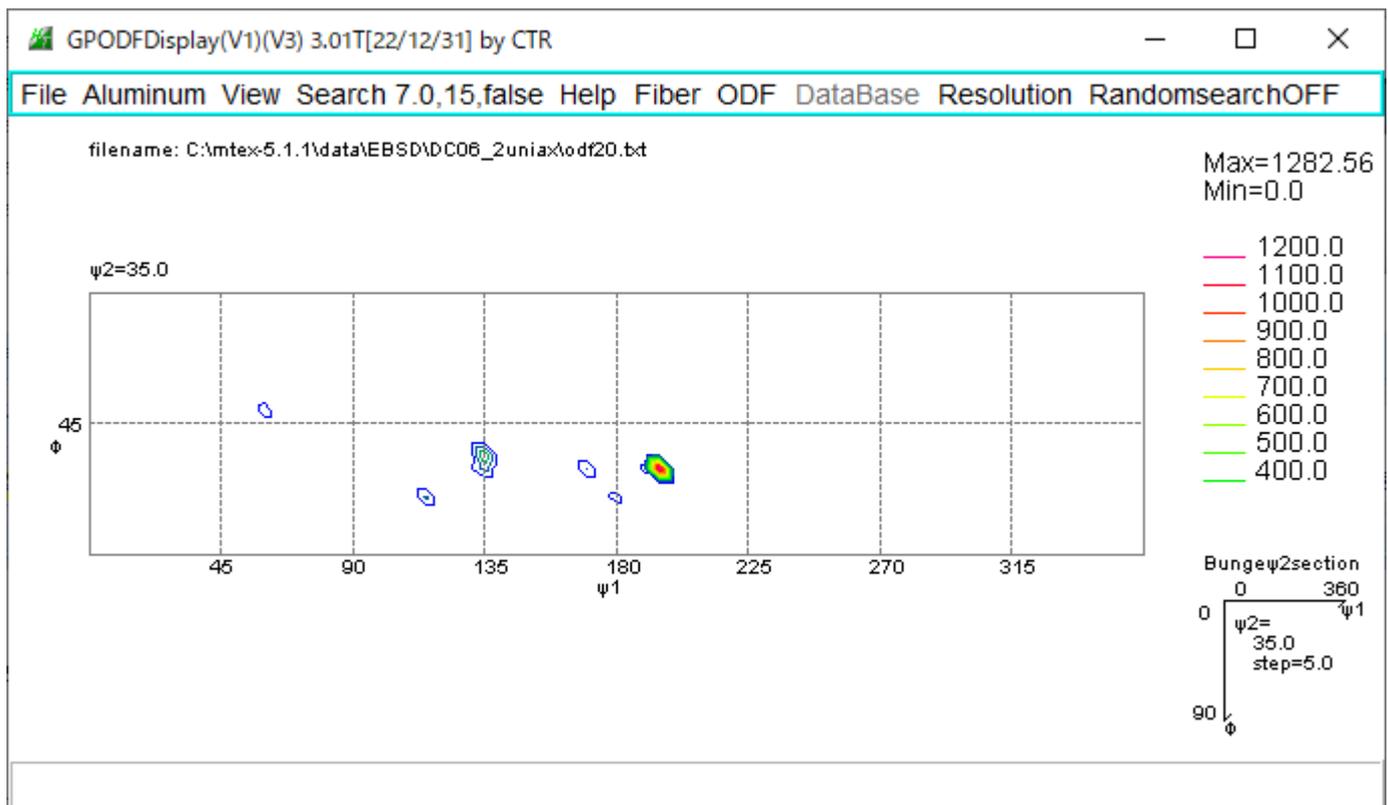

LaboTexでは1311.97と64.06に対し
MTEXで、1278, 66が得られます。

それぞれのODFをExportして比較

LaboTex $\phi = 35$

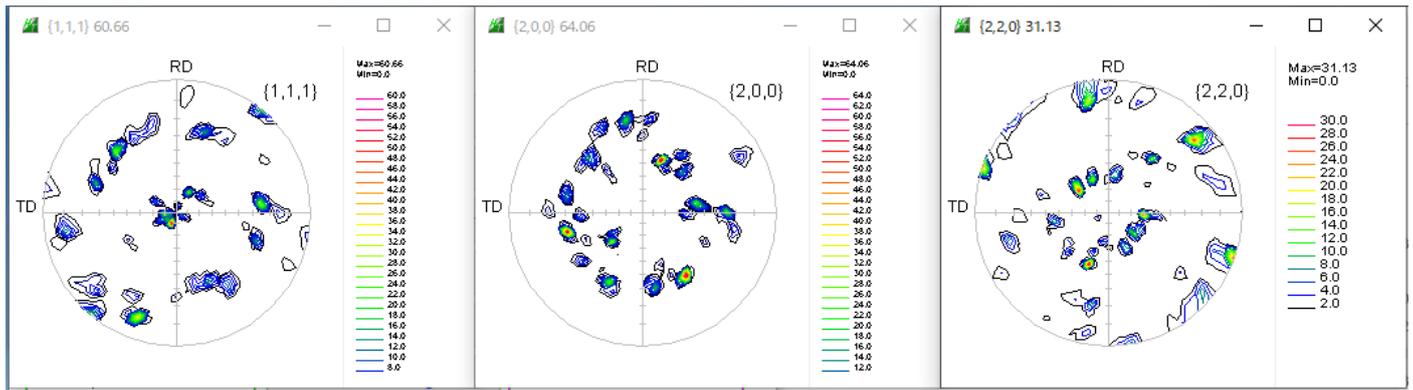

MTEx $\phi = 35$

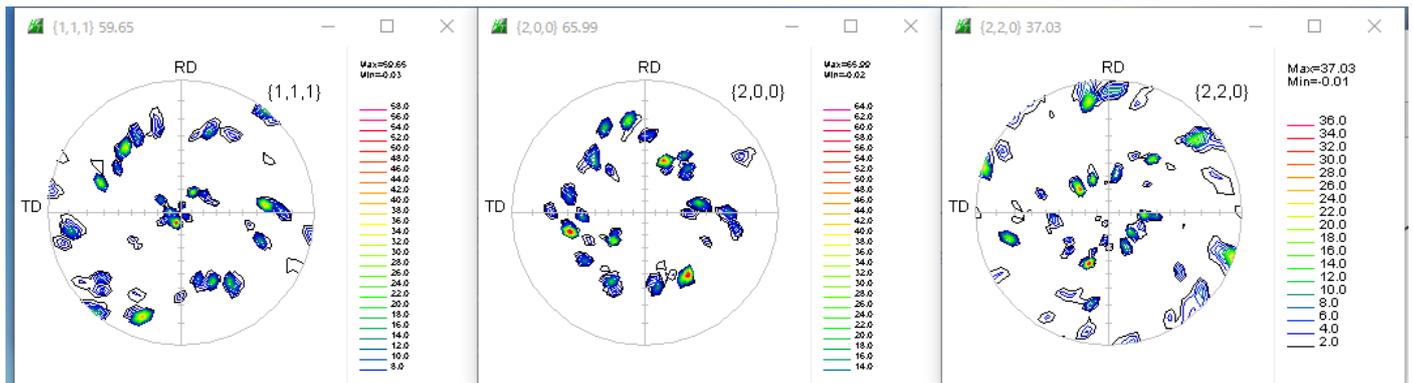

ほぼ同一の結果です。

極点図比較

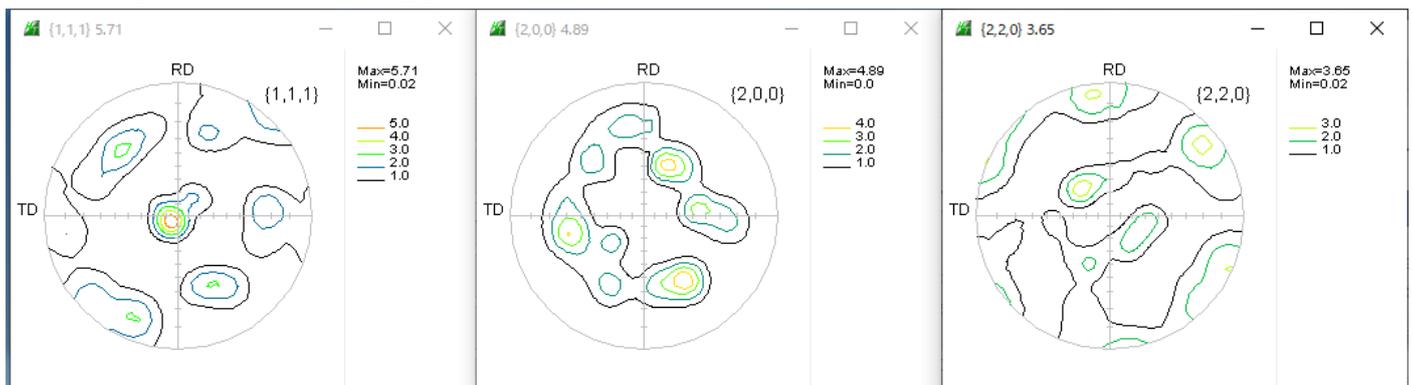

LaboTex

MTEX (FWHM=2.0 deg)

MTEX (FWHM=25 deg、EBSDデフォルトFWHM=25)

LaboTexでは、MTEXのFWHM=2.0 degと一致しています。
